

THEORY

1.What is Emmmit?

a. Emmmit is a toolkit for developers.It uses abbreviations and shorthand expressions to quickly generate full piece of code.While emit is enabled by default for HTML and CSS files in VScode. It requires small configuration to work with React's JSX Syntax. By adding specific settings to your settings.json file in vs code to Emmmit to recognize .jsx files.

2. Difference between Library and Framework?

a. Framework: Aframework provides a structured environment ,set of tools,guildelimes and often pre-built components to facilitate the applivation development.It defines the overall architecture and flow of the application called by the framework itself.

Library : A Library is a pre-written code designed to perform specific tasks.Your Application calls the library functions when ever it needed.

3.What is CDN.Why we use it?

❖ **a. CDN (Content Delivery Network)** is a network of servers worldwide that stores copies of files.Instead of downloading React, we use `<script crossorigin src="cdn-link">` to load it directly in browser.

We use CDN for:

- ❖ Faster loading from nearest serverNo installation needed
- ❖ Always get latest version
- ❖ Reduce our server load

4.Why React known as React?

a.React got name by its meaning.It responds/reacts by UI changing.Responds to the state stage easily.So it is known React is known as React.

5. What is crossorigin in script tag ?

a. It Controls how browsers handle scripts from different websites.If we use it we get better error details and more secure loading.

6.What is difference between Recat amd ReactDOM?

a. React is split into two separate libraries: **React** and **React DOM**, each with a distinct purpose. React itself is the core library that provides the fundamental building blocks for creating components, managing state, and handling logic. It's essentially the brain behind the operation,

defining how components behave and interact. React DOM, on the other hand, is the specialized library that takes these React components and renders them to the web browser's DOM. It acts as the bridge between the abstract world of React components and the actual web page you see, handling all the browser-specific operations and updates.

7.What is difference between react_development.js and react_production.js files via CDN?

a. Development Version:

- Includes helpful warning messages and error boundaries
- Larger file size with full debugging information
- Better for learning and development
- Slower performance but better debugging

Production Version:

- Minified and optimized for performance
- Removes all warning messages and extra checks
- Smaller file size for faster loading
- Used for live websites and final deployment
